

Customer Data Handling Policy

Readable PDF - useful for IronPDF text extraction and grounded response demos

Purpose

This policy explains how customer data should be classified, stored, shared, retained, and reviewed inside KnowledgeOps Portal. It is intended for employees who handle customer records, request notes, support attachments, or internal knowledge base documents.

Data Classification

Customer data must be classified before it is shared or processed. Public data may be reused in training examples. Internal data is limited to employees and approved contractors. Confidential customer data must be restricted to authorized personnel and should not be copied into public AI tools.

AI Assistance Rules

AI-generated summaries may support employee productivity, but they do not replace policy review or managerial approval. Any response that references customer-specific data must be grounded in approved portal records or uploaded source documents.

Retention and Review

Uploaded documents should be reviewed every 12 months or when a policy owner changes. Outdated documents should be marked for review before they are used for AI-grounded responses.

Control	Owner	Frequency	Evidence
Access review	Security Governance	Quarterly	Access report exported from identity system
Document review	Policy Owner	Annually	Updated policy record in KnowledgeOps
AI response audit	Operations Lead	Monthly	Sampled copilot conversation and source references
